

Pump Expendables

Weir SPM offers an extensive line of expendable parts for a variety of well service pumps, including Weir SPM and competitive models. Product offerings include various sizes and styles of valves, seats, packing and plungers.

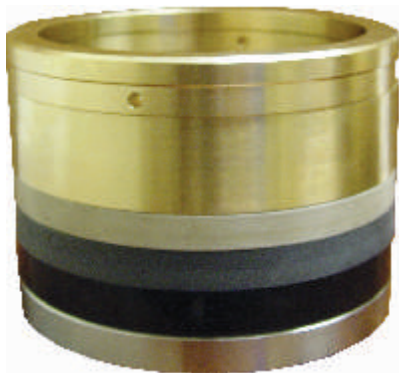

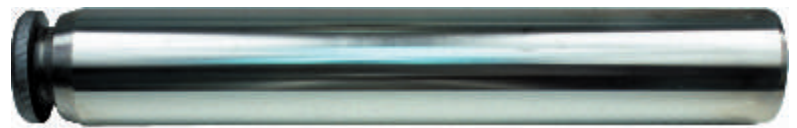

Weir SPM Valves & Seats:

Weir SPM valves and seats are designed to better withstand the negative effects of severe well service applications including high pressure and abrasive fluids. The valve body design allows a greater flow area, less abrasion, and lower fluid velocity through the seat. Weir SPM now offers a bonded valve insert designed to offer extended operational life and increased abrasion resistance, while making maintenance on the valve more convenient.

Weir SPM Plungers:

Weir SPM plungers are engineered and manufactured to precise dimensions with durable hardened coatings and surface finishes that are necessary for rugged well service applications. Weir SPM plungers provide long dependable service and are offered in a variety of sizes for each of Weir SPM's pump models for increased flexibility in customizing pump pressure capabilities and flow ratings. Customers now also have the option to repair damaged plungers through a plunger refurbishment program. Instead of scrapping, damaged plungers can be repaired to "like-new" condition allowing customers to reduce cost through extending the life of existing inventories.

High Performance Packing with Peek Adaptor

Weir SPM Standard Packing

Weir SPM Packing:

Weir SPM offers both traditional standard packing assemblies, as well as the High Performance Packing series. Weir SPM's line of High Performance Packing is designed and manufactured to give extended and dependable service life in high pressure, corrosive and abrasive pumping applications when compared to older packing styles. High Performance Packing is available in two styles, with or without peek adaptor. The peek adaptor is designed to offer increased load bearing support. High Performance Packing is the ideal pump packing product for increased performance and a reduction in maintenance requirements.
